LC: How were the magnificent pyramids built?

1) Quarrying and shaping the stones Large boulders were dug out of quarries.	
2) Moving the stones Large stones were placed on wooden poles or planks of wood. Water was poured on the ground to help the stones slide whilst Stone Haulers pulled them along.	
3) Raising the blocks of stones Ramps were built to help the Master Stone Movers pull the large stones into place.	
4) Aligning the pyramids The pyramids were very carefully aligned. The ancient Egyptians used a cubit rod to measure out the sides of the pyramids. It is believed that the ancient Egyptians used the stars as a guide to help them position the pyramids north, east, south and west.	
5) Placing the capstone Layers were added to the pyramid to create a protective outer shell. The capstone was placed on the very top.
